

COKALO

EXPLORE. DISCOVER. CELEBRATE.

Software Requirements & *Commercial Proposal*

A consumer travel platform for **hotels**, **water-sport experiences**, and **bus tickets** — built for the Indian market.

PROJECT

COKALO Travel Booking Platform

PREPARED BY

Codersdek

DATE

2026-05-24

MODULES

Hotels · Water Activities · Bus (3rd-party API integration)

DOCUMENT VERSION

v1.1

VALIDITY

15 days from above

1. Executive Summary

COKALO is a consumer travel platform that lets travellers discover and book three product lines on a single site:

- 1. Hotels** — search, filter, and book rooms across cities.
- 2. Water Activities** — discover water-sport operators ("companies") and book one or more activities in a single transaction.
- 3. Bus tickets** — search routes, view schedules, and book seats. Inventory and fulfilment delivered through a third-party bus aggregator API (e.g. RedBus / ITS / equivalent).

The platform comprises:

- **Customer web app** (public)
- **Admin panel** (platform operator's internal team)
- **Hotel manager portal** (each hotel runs their own listings & bookings)
- **Activity operator portal** (each water-sports company runs their own activities & bookings)
- **REST API backend** (PHP + MySQL)

This document captures the agreed scope, deliverables, timeline, quote, and commercial terms for the 3-month development engagement.

2. Project Scope

2.1 In Scope

Area	Description
Hotels module	Full booking pipeline — discovery, detail page, availability check, booking, manager portal, admin oversight.
Water Activities module	Full booking pipeline incl. multi-activity cart, operator portal, admin oversight.
Bus module	Customer-facing search → seat selection → booking → ticket. Inventory & fulfilment via one third-party bus API (provider mutually selected at kickoff).
User authentication	Email + OTP (login + signup), optional password fallback.
Admin panel	Property/operator CRUD, listings management, bookings oversight, reports/analytics for hotels & activities.
Manager portals	Independent dashboards for hotel managers and water-sport operators to manage their listings, slots/rooms, bookings, and walk-in entries.
Advanced dashboards	Sensible, role-specific dashboards for users, managers, operators, and admin. "Advanced" here means well-designed and useful — not BI / data-science depth. See Section 7.5 for the exact list of widgets included and Section 2.2 #14 for what is not considered part of "advanced".
GST module	Configurable GST rate, per-booking tax calculation, GST shown on invoice and admin reports.
Commission module	Per-vendor commission percentage (different rates per hotel / per operator / for bus aggregator). Platform splits gross / commission / net at booking time. Vendor and admin can view their split. See Section 7.4.
Responsive UI	Desktop + mobile web (no native iOS/Android app).
Email notifications	OTP, booking confirmation, status updates. SMTP via Codersdek's mail server or client-supplied SMTP.
Deployment	One round of deployment to client's chosen hosting (cPanel / shared host / VPS). India region.

Area	Description
Vendor-specific API modifications (during build window only)	If a hotel , a water-sports operator , or the chosen bus aggregator has their own API / PMS / back-office that requires custom integration to onboard, those modifications are included — but only during the active 3-month build window . Once the project goes live and the M4 milestone is signed off, any such API integration or modification becomes a paid change-request. See Section 2.2 #2 and Section 14.
Manual hotels / operators use the COKALO portals	Hotels and water-sports operators without their own API/back-office systems are onboarded through the Hotel Manager portal and Activity Operator portal built into COKALO. Their staff log in and manage rooms / slots / bookings using the platform's standard flows. No custom dashboards, no per-vendor branding, no bespoke flows.

2.2 Out of Scope (explicitly excluded)

- 1. Native mobile apps** (iOS / Android).
- 2. Post-launch custom modifications for individual hotels, operators, or bus carriers.** During the active 3-month build window (Section 11), custom integrations / modifications required to onboard a specific hotel's PMS, an operator's existing back-office, or the chosen bus aggregator are **included**. **After the M4 sign-off**, all such requests — including newly-onboarded hotels/operators that bring their own APIs — are paid change-requests billed at Codersdek's hourly rate. The platform itself remains a single-tenant codebase; per-property branding, white-labelling, or bespoke booking flows for any single vendor are not part of the base build.
- 3. Bus operator panel.** Bus inventory is consumed entirely from the third-party API. There is no fleet / route / schedule management UI for bus operators on COKALO.
- 4. Multiple bus API integrations.** One provider only. Switching providers, supporting fallback providers, or aggregating multiple APIs is out of scope.
- 5. Third-party service costs.** Codersdek's fee covers development only. The following are **billed separately** and paid for by the client:
 - Bus aggregator API subscription & per-booking fees (RedBus, ITS, etc.)
 - Payment-gateway fees (Razorpay / Stripe / etc.)
 - SMS / WhatsApp messaging fees
 - SMTP / transactional-email service fees (if not using cPanel mailbox)
 - Hosting, domain, SSL certificate
 - Map / geocoding API usage (if added)
- 6. Payment-gateway integration** beyond a single provider (e.g. Razorpay). Multiple gateways or wallet-by-wallet integrations are out of scope.
- 7. Indian market only.** The platform is built for the Indian market — INR currency, IST timezone, Indian phone-number formats, Indian GST tax structure, Indian payment gateway. International

support (multi-currency, multi-timezone, foreign payment methods, VAT/sales-tax, non-Indian addresses) is **not** in scope.

8. Multi-language / i18n. English only.

9. Multi-currency. INR only.

10. SEO content writing, copywriting, and stock photography. Client supplies hotel/activity images and descriptive text.

11. Server administration after handover. One-time deployment is included; ongoing DevOps and server upkeep is not.

12. Source-code modifications after final sign-off. Bug fixes related to the delivered scope are covered for **30 days post-launch**. New features or scope changes after that period are change-requests, billed separately.

13. Post-delivery maintenance / AMC. Ongoing maintenance, support, monitoring, server patching, security updates, third-party API change handling, performance tuning, periodic enhancements, and small feature additions after the 30-day bug-fix window are **explicitly out of scope** of this quote and are **billed separately** under a maintenance agreement (AMC) or per change-request. See Section 15.5.

14. Enterprise-grade analytics / BI. "Advanced dashboards" in this SRS means the curated widget set listed in Section 7.5 (revenue trends, occupancy, source mix, top performers, etc.). The following are **not** part of "advanced" and are out of scope: custom report builders, ad-hoc SQL, data-warehouse / OLAP cube, cohort and funnel analytics, predictive models, real-time streaming dashboards, drill-down BI tools, export to BI platforms (Tableau/Power BI/Looker).

3. System Architecture

3.1 Components

Component	Responsibility
Customer Web App	Browse hotels/activities/buses, book, manage own bookings, login (email OTP / password).
Admin Panel	CRUD for hotels, activities, operators, bookings oversight, reports.
Hotel Manager App	Per-hotel dashboard — manage rooms, view/manage bookings, walk-ins.
Activity Operator App	Per-operator dashboard — manage activities and slots across cities, view/manage bookings, walk-ins.
PHP REST API	Authoritative source for all data; JWT-secured endpoints; pluggable mailer (PHPMailer + SMTP).
MySQL DB	Single relational DB (<code>busgo_db</code>).
Bus Aggregator API	External provider for bus inventory, seat layout, hold, ticket. Specifics depend on the selected provider's contract.

4. Module 1 — Hotels

4.1 Customer-facing requirements

ID	Requirement
H-C01	Hotels listing page filterable by city, price range, star rating, guest rating, property type (Hotel / Resort / Service Apartment / Independent House / Villa / Guest House / Hostel / Boutique / Apartment), guest capacity, and amenities.
H-C02	Hotel detail page with image, description, address, amenities, list of bookable rooms.
H-C03	Date-range availability check (check-in / check-out / guests).
H-C04	Single-room booking flow with instant confirmation and booking code.
H-C05	Email confirmation after successful booking.
H-C06	"My Bookings" page — view all current and past hotel bookings, cancel where allowed.

4.2 Hotel Manager portal

ID	Requirement
H-M01	Login (separate JWT realm).
H-M02	Dashboard with today's check-ins, check-outs, current guests, month bookings, month revenue.
H-M03	Edit own hotel profile (name, city, address, description, image, amenities). Star rating and guest rating are admin-managed only.
H-M04	Rooms CRUD — create, edit, disable, delete room types (room type, price/night, capacity, total units, image, amenities).
H-M05	Bookings list with status filter and source filter (website vs walk-in).
H-M06	Create walk-in booking on behalf of a guest (room, date range, guest details).

ID	Requirement
H-M07	Confirm or cancel pending bookings.
H-M08	Reports — month-by-month revenue trend, source mix, revenue by room type.

4.3 Admin oversight (hotels)

ID	Requirement
H-A01	Hotels list with stats (rooms, bookings, status).
H-A02	Hotels CRUD including star/guest rating fields.
H-A03	Flat list of all rooms across all hotels with hotel filter.
H-A04	Flat list of all hotel bookings.
H-A05	Disable a hotel (hides from public site but preserves data).
H-A06	Reports — platform-wide hotel revenue & bookings.

5. Module 2 — Water Activities

5.1 Customer-facing requirements

ID	Requirement
A-C01	"Companies" listing — water-sports operators with city/category filters.
A-C02	Operator (company) landing page — header with brand, then activities grouped by city; option to filter highlighted activities by the user's search category.
A-C03	Activity detail — description, includes, difficulty, duration, slot options.
A-C04	Date + persons input shared across the cart.
A-C05	Multi-activity cart — add multiple slots from one operator; remove items; live total.
A-C06	Transactional checkout — all cart items booked in a single atomic call. If any single slot is unavailable, the entire cart rolls back.
A-C07	Booking confirmation page listing each booking code.
A-C08	"My Bookings" includes water-activity bookings, with cancel where allowed.

5.2 Activity Operator portal

ID	Requirement
A-O01	Login (separate JWT realm).
A-O02	Dashboard — activity count, today's bookings, today's persons, upcoming bookings, monthly revenue.
A-O03	"My Activities" — list of all activities owned by the operator.
A-O04	Activity CRUD — create, edit, disable, delete activities (name, city, category, difficulty, duration, image, includes)

ID	Requirement
A-O05	Slot management within each activity — slot label, departure time, duration, price/person, max persons, image.
A-O06	Bookings list with activity / status / source filters.
A-O07	Walk-in booking — pick activity → pick slot → enter guest details.
A-O08	Confirm / cancel pending bookings.

5.3 Admin oversight (activities)

ID	Requirement
A-A01	Activities list with operator + stats.
A-A02	Activities CRUD; optional assignment to an operator (unassigned activities are admin-managed).
A-A03	Flat list of all slots across all activities with activity filter.
A-A04	Flat list of all activity bookings.
A-A05	Operators CRUD — create, edit, disable, delete operator accounts.
A-A06	Reports — platform-wide revenue, top activities, source mix.

6. Module 3 — Bus (3rd-party API integration)

Important constraint: This module's feature set is **constrained by the capabilities of the selected third-party bus API provider**. What this document promises is the **integration of features the chosen provider exposes** — not a wishlist of features the API may not support. The exact provider (RedBus, ITS Mobisoft, AbhiBus, etc.) is to be jointly selected at project kickoff.

6.1 Customer-facing requirements (subject to API)

ID	Requirement
B-C01	Bus search page — origin city, destination city, journey date, optional return date.
B-C02	Results list with operator, bus type, departure / arrival times, duration, fare, available seats.
B-C03	Filters (subject to API data) — bus type, departure time window, operator, price range.
B-C04	Seat-selection page — interactive seat map from the API, lower/upper deck where applicable.
B-C05	Passenger details + boarding point selection.
B-C06	Payment via single integrated payment gateway.
B-C07	Ticket confirmation — PNR / booking code, e-ticket displayed and emailed.
B-C08	"My Bookings" — view bus tickets, with cancel (where the API supports it).

6.2 Admin oversight (bus)

ID	Requirement
B-A01	Bus bookings list — all bookings made through the platform with status, PNR, customer details.
B-A02	Reconcile booking status against the provider (manual refresh button).
B-A03	Basic reports — bookings count and revenue by month.

6.3 Out of scope (bus module)

- No bus operator panel.
 - No internal fleet / route / schedule / seat-layout management.
 - No support for offline / non-API operators.
 - No multi-aggregator fallback or routing.
 - Refunds, chargebacks, dispute resolution follow the **provider's** rules and timeline; COKALO does not warrant outcomes beyond what the API returns.
-

7. Common / Cross-Cutting Features

7.1 Authentication

ID	Requirement
AUTH-01	Email + OTP signup (single flow). Optional password set during signup.
AUTH-02	Email + OTP login (default). Email + password login (optional fallback for users who set a password).
AUTH-03	6-digit OTP, 5-minute expiry, max 5 attempts per code, 60-second resend cooldown, max 3 requests per email per 10 minutes.
AUTH-04	OTP delivery via SMTP (PHPMailer).
AUTH-05	Separate JWT realms for users, admins, hotel managers, activity operators.

7.2 Notifications

ID	Requirement
N-01	OTP email (verification).
N-02	Booking confirmation email (per booking).
N-03	Booking cancellation email (when cancelled by user or operator/manager).

7.3 Branding & UI

ID	Requirement
UI-01	Single brand identity — COKALO logo, purple/blue colour palette, Playfair + Inter typography.
UI-02	Responsive across desktop, tablet, mobile breakpoints.
UI-03	Tested on latest Chrome, Edge, Safari, Firefox.

7.4 Commission & GST module

ID	Requirement
FIN-01	Per-vendor commission rate. Admin can configure a commission percentage per hotel and per water-sports operator (default fallback if not set). For bus bookings, a flat platform-level commission rate is configured.
FIN-02	Booking split. At booking creation, the system records: gross amount, commission (%) and amount, GST (%) and amount, vendor net. All four are stored on the booking row so reports always reconcile.
FIN-03	GST rate. Admin can configure a single GST rate (or per-category rate — Hotels, Activities, Bus). GST is calculated and shown on every customer invoice and operator/manager statement. Default split (CGST+SGST vs IGST) follows a configurable rule based on the billing address.
FIN-04	Customer invoice. Booking confirmation email and downloadable PDF invoice show: line item, base amount, GST breakdown (CGST/SGST/IGST), total. Includes the configured GSTIN of the platform.
FIN-05	Vendor statement. Each hotel manager / activity operator can view a statement of their bookings — gross, commission deducted, GST collected on their behalf, net payable. Month and date-range filters.
FIN-06	Admin reconciliation. Admin sees a roll-up — total gross, total commission earned, total GST collected, total net payable to each vendor — for a chosen period. Export to CSV.
FIN-07	Bus commission. Where the third-party bus API exposes the commission/markup, the platform records the API-reported figure. Where the API doesn't expose it, the platform's configured flat-rate applies.

Out of scope (FIN): automated payouts to vendors (Razorpay X / banking integration), TDS withholding, e-invoicing on GSTN, ITC reconciliation, GST return filing (GSTR-1 / GSTR-3B). The platform produces reports that a CA / accountant can use — it does not file returns. (See Section 2.2 #14.)

7.5 Dashboards — scope of "advanced"

What "advanced dashboards" includes (per role):

Role	Widgets included
Customer	"My bookings" with status pills (upcoming / completed / cancelled), grouped by module (hotels / activities / bus), cancel button where allowed.

Role	Widgets included
Hotel manager	Today's check-ins / check-outs / current guests / month bookings / month revenue. Upcoming bookings table. Revenue trend (last 6 months). Source mix (website vs walk-in). Revenue by room type.
Activity operator	Activity count, today's bookings, today's persons, upcoming total, monthly revenue, monthly bookings. Upcoming bookings table (across all activities).
Admin	Platform-wide gross / commission / net / GST collected for current period. Top 5 hotels and top 5 activities by revenue. Monthly trend (6 months). Source mix. Operator-wise commission roll-up.

What "advanced" does **not** mean (out of scope, billed separately if needed later):

- Custom report builders and ad-hoc query interfaces
- Drill-down BI / OLAP / pivot tables
- Cohort analysis, funnel analytics, retention curves
- Predictive / ML forecasting
- Real-time live-streaming dashboards
- Native exports to Power BI / Tableau / Looker / Google Data Studio
- Per-tenant white-labelled dashboards
- Vendor-side mobile app for the dashboard

8. Non-Functional Requirements

ID	Requirement
NFR-01	Performance — public list pages render under 2 seconds on standard broadband and a database with $\leq 10,000$ records per table.
NFR-02	Concurrency — atomic multi-booking checkout must be safe against parallel cart submissions (row-level locking inside DB transaction).
NFR-03	Security — all admin / manager / operator endpoints behind JWT auth; passwords stored as bcrypt hashes; OTPs single-use with expiry; CORS allowlist restricted to known portal origins; SQL via parameterised PDO.
NFR-04	Logging — server errors logged to PHP error log; SMTP failures surfaced via API errors.
NFR-05	Rate limiting — OTP requests rate-limited per email.
NFR-06	Browser support — last 2 versions of Chrome, Edge, Safari, Firefox.
NFR-07	Backup — client is responsible for periodic DB backups post-handover.

9. Technology Stack

Layer	Technology
Customer / Admin / Manager / Operator frontends	Next.js 14 (React), JavaScript, CSS modules
API / Backend	PHP 8.x, PDO + MySQL
Mail	PHPMailer 6.x over SMTP
Authentication	Custom HS256 JWT
Database	MySQL 8.x / MariaDB 10.x
Hosting target	XAMPP for dev; cPanel-based shared host or Linux VPS for production

| 10. Deliverables

At the end of the engagement, Codersdek will deliver:

1. **Source code** for all four frontends and the PHP backend, via a private Git repository (or zipped on request).
 2. **Database schema** as a single SQL file plus migration scripts.
 3. **One-page deployment guide** covering server requirements, env-file values, and seed steps.
 4. **Admin / manager / operator credentials** for the production deployment.
 5. **30-day post-launch bug-fix support** — issues directly attributable to the delivered scope.
-

11. Project Timeline & Milestones

Duration: ~12 weeks from project kickoff — **10 May 2026 → 31 July 2026**. **Working assumption:** kickoff = day 0; week = 7 calendar days.

Milestone	Week	Target date	Deliverables	Payment release
M0 — Kickoff	0	10 May 2026	Signed proposal, requirements walkthrough, branding assets received, third-party bus provider selected.	INR 50,000 advance
M1 — 25%	3	31 May 2026	Hotels module customer + manager portals live in staging. Auth + OTP working end-to-end. Brand + design system applied.	INR 50,000
M2 — 50%	6	21 Jun 2026	Water Activities module live in staging — customer + operator portals + admin oversight. Multi-activity cart + transactional checkout working.	INR 50,000
M3 — 75%	9	12 Jul 2026	Bus module integrated with chosen 3rd-party API — customer search, seat selection, payment, confirmation. Admin reconcile screen.	INR 50,000
M4 — 100%	12	31 Jul 2026	Production deployment, smoke-tested. Bug-fix sprint completed. Handover documents delivered. Project signed off.	INR 50,000

Schedule risk note: any delay caused by pending client inputs (logo, copy, content, API credentials, sandbox approvals, payment-gateway KYC, etc.) shifts the timeline day-for-day. Approval delays beyond 5 working days on any milestone are treated as a client-side hold.

12. Acceptance Criteria

Each milestone is deemed accepted when:

1. The features listed against that milestone are demoable on the staging environment.
2. The client (or nominee) signs off within **5 working days** of the demo email. Silence beyond 5 working days will be treated as deemed acceptance for the purposes of payment release.
3. Show-stopper bugs — defined as security flaws or features that simply do not work — are excluded from deemed acceptance and must be fixed before the milestone closes.

Final acceptance at M4 requires:

- Successful production deployment with all flows demonstrably working against the live database.
 - Admin / manager / operator credentials handed over.
 - No open show-stopper bugs.
-

13. Assumptions

1. Client provides all hotel/activity content (descriptions, images, amenities) by the start of M1.
 2. Client provides bus-API provider credentials and any required KYC approvals by the start of M3.
Without these, the bus module cannot be integrated and the M3 milestone slips on a day-for-day basis.
 3. Client provides payment-gateway test + live credentials by the start of M3.
 4. Client provides domain, hosting account, SSL certificate, and DNS access by the start of M4.
 5. The platform runs as a single-tenant codebase. Branding is single-brand (COKALO).
 6. Communication will be via a single point of contact on the client side; ad-hoc requests from third parties will be redirected through that contact.
 7. Scope changes after sign-off (i.e. anything not explicitly listed in Section 4–Section 7) are change-requests and are billed separately at Codersdek's hourly rate.
-

14. Change Requests

- Requests for new features beyond Section 4–Section 7 will be scoped, estimated, and quoted as a written change-request before any work begins.
 - Approved change-requests adjust the timeline and may extend the final delivery date.
 - Cosmetic / minor edits (copy tweaks, small CSS adjustments) during active development are absorbed at Codersdek's discretion and don't require a formal change-request.
-

15. Commercial Proposal

15.1 Quote

Item	Amount (INR)
Development of COKALO platform — 3 modules (Hotels + Water Activities + Bus 3rd-party integration) including admin panel, two manager portals, customer web app, REST API, database, deployment, 30-day post-launch bug fixes	INR 2,50,000
Total	INR 2,50,000

All figures are in Indian Rupees. GST extra at applicable rate if the client requires a GST invoice.

15.2 What is not included in the quote

- Bus aggregator API subscription / per-booking commissions
- Payment-gateway transaction fees
- SMS / WhatsApp / transactional-email fees
- Hosting, domain, SSL
- Map / geocoding API usage
- Content writing, photography, marketing
- Any third-party plugin / library license fees beyond open-source dependencies already in use

The client pays these directly to the respective service providers. Codersdek will guide setup but does not absorb usage costs.

15.3 Payment Schedule

Five equal instalments of **INR 50,000 each**, releasing against milestone acceptance per Section 11.

#	Trigger	Amount
1	Signed proposal — kickoff advance	INR 50,000
2	M1 acceptance (25%)	INR 50,000
3	M2 acceptance (50%)	INR 50,000
4	M3 acceptance (75%)	INR 50,000
5	M4 acceptance — final go-live (100%)	INR 50,000

#	Trigger	Amount
	Total	INR 2,50,000

15.4 Payment Terms

1. Each milestone invoice is payable within **5 working days** of acceptance.
2. Late payment beyond 10 working days pauses further development; the timeline shifts day-for-day until payment is received.
3. Payment via NEFT / IMPS / UPI to Codersdek's designated bank account (details on invoice).
4. The advance payment is non-refundable once kickoff has occurred (i.e. requirements walkthrough completed and assets transferred).
5. Source code and credentials are released to the client **only after the final invoice is settled**.
6. Any third-party service costs incurred for testing during development (sandbox SMTP, sandbox payment gateway, etc.) are billed at actuals against receipts, separate from the project fee.

15.5 Post-launch Support

- **30 days** of bug-fix support included from the go-live date. "Bug" means a feature listed in this SRS that does not work as specified.
- **All other post-delivery work is billed separately.** This includes — without limitation — new features, scope additions, third-party API changes (RedBus / payment gateway / SMTP / etc. publishing breaking changes), server administration, performance tuning, security patching, periodic enhancements, onboarding new hotels / operators that require any custom API integration, version upgrades of Node / PHP / MySQL / Next.js, plugin or library updates, content moderation, customer support, marketing collateral, and any feature requests originating from individual hotels / operators or end users.
- These can be engaged either as **one-off change-requests** (quoted on demand) or under a **separate Annual Maintenance Contract (AMC)** with monthly retainer hours. AMC terms are outside the scope of this proposal and are negotiated as a separate agreement at the end of the 30-day bug-fix window.

15.6 Validity

This proposal is valid for **15 days** from the document date.

16. Sign-off

The signatures below indicate agreement to:

- the scope defined in Section 2 through Section 7;
- the exclusions listed in Section 2.2 and Section 6.3;
- the timeline and acceptance process in Section 11–Section 12;
- the commercial terms in Section 15.

For the Client	For Codersdek
Name: _____	Name: _____
Title: _____	Title: _____
Signature: _____	Signature: _____
Date: _____	Date: _____

Appendix A — Glossary

Term	Meaning
Operator	A water-sports company that owns and runs one or more activities on COKALO.
Manager	A hotel staff account with rights to one specific hotel.
Admin	A COKALO platform staff account with full oversight.
Slot	A specific time-of-day departure for a water activity (e.g. "Morning Trip @ 9 AM").
Walk-in booking	A booking entered into the system by a manager/operator on behalf of a guest who isn't using the website.
Property type	Categorisation of a hotel — Hotel, Resort, Service Apartment, Villa, Guest House, etc.
PNR	Passenger Name Record — the bus aggregator's unique booking reference.

Appendix B — Document Revision History

Version	Date	Author	Changes
1.0	2026-05-21	Codersdek	Initial release for client review and sign-off.
1.1	2026-05-24	Codersdek	Section 11 milestones anchored to fixed dates (M0 = 10 May 2026, M4 = 31 Jul 2026).
